

# ENG KONG AI JOURNEY

At Eng Kong, we have always believed that progress comes from adapting to change and preparing for the future. In today's rapidly evolving landscape, artificial intelligence is becoming a key driver of transformation across the logistics and supply chain industry. As a trusted player in the container logistics industry, we recognize that operational excellence is increasingly supported by digital technologies and intelligent systems that enhance productivity and empower our workforce.

We are pleased to officially commence our transformation through the Eng Kong AI Journey in collaboration with Beyondsoft, marking the beginning of our transition from being AI-curious to becoming AI-capable.

This initiative is not just about adopting new technology. It is about rethinking how we work, improving operational efficiency, strengthening decision-making, and building future-ready capabilities across our organization. From improving day-to-day workflows to enabling responsible automation across complex depot processes, artificial intelligence has the potential to reshape how container logistics businesses operate. It helps to create safer, smarter, and more efficient working environment.

This meeting served as a valuable platform to align our vision, explore opportunities, and begin identifying practical use cases where AI can create meaningful impact for Eng Kong. Together with Beyondsoft, we aim to build a structured and sustainable AI roadmap that supports both innovation and operational reliability.

---

As we embark on this journey, we recognize that digital transformation requires collaboration, learning, experimentation, and commitment across teams. In line with this vision, we aim to pioneer AI-driven solutions for our industry. This is only the beginning, but it is an important first step toward building a smarter, more connected, and more resilient organization.

We look forward to sharing more updates as the Eng Kong AI Journey progresses.
